Redesign and Requalify the Neighborhood in the City

Intervention in the Neighborhood with housing, equipment and public space as a way of requalifying the Neighborhood and Place

Proposed Intervention Area: ODIVELAS,
Sr. Roubado/Odivelas Centro

Laboratório

Projecto VI 2020.2021

Academic year 2020.2021 / 1st semester
Integrated Master in Architecture
Professor Pedro Rodrigues

Subject Objectives and Theme

The theme of this project of Architecture and Urban Design, is to Redesign and Requalify the Neighborhood in the City and Intervene in the Neighborhood with housing, equipment and public space as a way of requalifying the Neighborhood and Place.

We considered as the first objective of the project intervention, the critical approach of the city in its different contexts of formation and contemporary problems, in the metropolitan area of Lisbon, in Mr. Roubado in Odivelas.

This project will be developed under a protocol with the Odivelas City Council. It is intended that the project solution uses a set of methodologies that resort to the

analysis of the place, the diagnosis and the intervention proposal, materialized in the integrating Architecture and Urban Design project.

The aim of this Project is to obtain the identification of the support structures in architecture based on the theme associated with Urban Rehabilitation, the Neighborhood in the City and highlighting the theme of Sustainability and the Rehabilitation of urban voids in vacant spaces in the City.

It is also intended to develop systems that allow, in a sensitive way, to establish and connect the Community with the Neighborhoods, which are disjointed with each other. Based on the critical sense of observation, it is also our goal to redesign housing typologies, maintaining the identity of the place through surgical insertions of common / public equipment.

With this theme we aim to arouse interest and reflection on the tectonic and typological operative references associated with the understanding of the place of Senhor Roubado in Odivelas. The strategic intervention program will be developed from scale 1: 2000 to Esc. 1: 200.

It is also a project objective to think about how to refunctionalize the countless urban voids, favor the implementation of new means of conception and production of the sustainable city in the urban context, combating the abandonment of historic industrial areas and urban voids that are the result of the failure of operations urbanistic. At the same time, the project aims to establish a benchmark of indicators that can contribute to the development of the Final Master's Project
